Amendments to the Claims:

Claims 1, 35, 36, and 37 are currently pending. Claim 1 has been amended. This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) Apparatus for accessing content contained on a storage medium, the content including a plurality of ~~programs~~ titles such that each ~~program~~ title includes a plurality of ~~scenes~~ chapters and each ~~scene~~ chapter includes a plurality of frames, the ~~programs~~ titles and the ~~scenes~~ chapters include information for moving pictures, the apparatus comprising:

a driver module configured to access the content and having a driver output to produce an information signal for the accessed content;

a decoder module operatively coupled to the driver module to receive the information signal;

a user input module configured to receive user input with at least a select button and/or a cursor button; and

a system control module configured to control, the driver and decoder modules to produce a first display signal for the plurality of ~~programs~~ titles, each of the ~~programs~~ titles being represented by a single frame in the first display signal, at least these single frames for the plurality of programs are configured to be displayed on a display module as a title selection screen based on the first display signal,

wherein the system control module, in response to receiving a user-specified ~~program~~ title selection from the select button is configured to control the decoder module to produce a second display signal for the plurality of ~~scenes~~ chapters, each of the ~~scenes~~ chapters being represented by a single frame in the second display signal, at least these single frames for the plurality of ~~scenes~~ chapters are configured to be displayed on a display module as a chapter selection screen based on the second display signal, and

PATENT

wherein the system control module, in response to receiving a user-specified ~~program~~ title selection from the cursor button, is configured to control the decoder module to play back automatically the ~~selected program~~ user-specified title as a small frame if there is no button input for a select period of time.

2 - 34. (Canceled)

35. (Previously presented) The apparatus of claim 1, wherein playback is performed as skipping playback or as fast-forward playback.

36. (Previously presented) Apparatus for accessing content contained on a storage medium, the content includes a plurality of programs such that each program includes a plurality of scenes such that each scene includes a plurality of frames, the programs and the scenes include moving pictures, the apparatus comprising:

a driver module configured to access the content and having a driver output configured to produce an information signal for the accessed content;

a decoder module operatively coupled to the driver module to receive the information signal;

a user input module configured to receive user input with at least a selection button or a cursor button; and

a system control module configured to control the driver module and the decoder module to produce a first display signal for the plural plurality of programs, each of the programs being represented by a single frame in the first display signal, at least these single frames for the plurality of programs are configured to be displayed on a display module based on the first display signal,

wherein the system control module, in response to receiving a user-specified program selection from the select selection button, controls the decoder module to produce a second display signal for the plurality of scenes, each of the scenes being represented by a single

frame in the second display signal, at least these single frames for the plurality of scenes are configured to be displayed on a display module based on the second display signal, and

wherein the system control module, in response to receiving a user-specified scene selection from the cursor button, is configured to the decoder module to play back automatically the selected scene as a small frame if there is no button input for a select period of time.

37. (Previously presented) The apparatus of claim 36 wherein playback is performed as skipping playback to fast-forward playback.
